

# What should my SPF records show?

Created by Corey Tutewiler

Last updated Sep 10, 2019 by Jon Vandenbossche

The purpose of an SPF record is to prevent spammers from sending messages with forged from addresses at your domain. Recipients can refer to the SPF record to determine whether a message purporting to be from your domain comes from an authorized mail server.

It is helpful to add Gaggle to your SPF Records to ensure that your email communications successfully send:

For Google:

v=spf1 include:[gaggle.net](https://gaggle.net) ~all

For additional information, see [Google App's support material on SPF Records](#).

For Microsoft:

v=spf1 include:[spf.gaggle.net](https://spf.gaggle.net) include:[spf.protection.outlook.com](https://spf.protection.outlook.com) ~all

For additional information, see [Microsoft's support material on SPF Records](#).
